

HiveX — Connector Expansion Roadmap

Planning document · Prepared 2026-08-06 · Status: Not yet built

Done by Abhay

This document outlines a proposed expansion of HiveX connectors beyond the existing Slack, Outlook, and Zoom integrations. It is a **plan, not a shipped feature** — nothing described here is built yet. See *README.md* for what is live today and *TECHNICAL.md* for the implementation pattern every entry below would follow.

1. Scope Decisions Already Made

GA4, Google Ads, and GSC are explicitly excluded.

These already have a full, separate, native Google OAuth pipeline in this repo (server/app/connectors/google/, server/app/connectors/google_sync/), with dedicated report builders and MCP tools. Adding them again via Nango would duplicate working infrastructure — out of scope for this initiative.

Self-hosting Nango was considered and rejected for now.

Live usage as of 2026-08-06 was 1 real connection across 5 companies / 13 users — nowhere near justifying the operational cost of running Nango's self-hosted stack (5 Node services + Postgres + Redis + Elasticsearch + S3-compatible storage). Revisit only once real connection count crosses ~150–200 (roughly where hosted overage cost reaches ~\$700–800/mo) or the team has dedicated infra/DevOps capacity to own that stack. Until then, stay on Nango's hosted plan and upgrade tiers as needed:

Tier	Price	Included	Overage
Free	\$0	10 connections	—
Starter	\$50/mo	20 connections	\$1/connection
Growth	\$500/mo	100 connections	\$1/connection

All plans are pay-as-you-go with no hard caps.

2. Confirmed Nango Integration Slugs

Verified live against Nango's docs/changelog on 2026-08-06 — not guessed. Several looked plausible but needed a real docs-page hit to confirm, since absence from Nango's curated “popular” marketing page isn't evidence of absence from their real 900+ provider catalog.

Tool	Nango slug	Auth type	Confidence / notes
Gmail	google-mail	OAuth	Confirmed
Google Drive	google-drive	OAuth	Confirmed
Google Calendar	google-calendar	OAuth	Confirmed
Notion	notion	OAuth	Confirmed
Monday.com	monday	OAuth	Confirmed
Microsoft OneDrive	one-drive	OAuth	Confirmed
ClickUp	clickup	OAuth	Confirmed
HubSpot	hubspot	OAuth	Confirmed
ActiveCampaign	active-campaign	OAuth	Confirmed
Marketo	marketo	OAuth	Confirmed
Brevo (formerly Sendinblue)	brevo-api-key	API key	Confirmed — resolves “Bravo” from original list; added to Nango Nov 2024, no dedicated setup guide yet
Intercom	intercom	OAuth	Confirmed
Figma	figma	OAuth	Confirmed — separate figma-scim variant exists for SCIM provisioning, not relevant here
SEMrush	semrush	API key	Confirmed — Nango docs title it “Semrush (v3)”
Granola	granola	—	Confirmed
Fathom	fathom	API key	Confirmed — this is Fathom Video (AI meeting notetaker), not Fathom Analytics
Looker	looker	API3 key + hostname	Confirmed, needs manual dashboard check — verify classic Looker (BI tool), not Looker Studio
Wappalyzer	wappalyzer (likely)	—	UNCONFIRMED — appears in Nango changelog but docs page wouldn't render; confirm slug on dashboard before building

3. Rollout Phases

Grouped by technical reuse and build complexity, **not** assumed business priority — final ordering is a product call, not an engineering one.

Every tool follows the same build pattern: a new `backend/modules/connectors/connectors/<provider>.py` (list targets + fetch content via Nango proxy), wired into `query_router.py`'s mention parsing, `context_builder.py`'s formatting, `handler.py`'s dispatch, and `chatbotPage.tsx`'s composer (tool option + # picker + replace logic) — see *TECHNICAL.md* for how Slack/Outlook/Zoom already do this. The real per-tool variable is auth type (OAuth popup vs. API-key entry — Nango's Connect UI handles both, confirm per-provider when building) and whether it needs a send/deliver action (like Slack/Outlook) or is read-only (like Zoom).

Phase 1 — Reuse the existing Google OAuth app

Gmail, Google Drive, Google Calendar

This repo already has a Google Cloud OAuth client registered for the GA4/Ads/GSC pipeline. Worth checking whether that same Client ID/Secret can be reused across these three Nango integration configs (just add the extra scopes), instead of registering a new Google Cloud app from scratch. Read-only to start; Gmail could grow a “send” action later, same shape as Outlook.

Phase 2 — Project/notes tools (parallel to the existing Kanban feature)

Notion, Monday.com, ClickUp

All OAuth. Read-only (summarize a page/board/task) to start; “create a task” as a write action is a natural follow-up but bigger scope — scope separately once read-only ships.

Phase 3 — Marketing/CRM (closest fit to this product's domain)

HubSpot, ActiveCampaign, Marketo, Brevo, Intercom

Probably where the real business value is, given the product's marketing-agency focus — candidate for going first despite Phase 1/2 being technically cheaper to build.

Phase 4 — Design/SEO/BI (narrower, likely lower chat-usage frequency)

Figma, SEMrush, Looker, Wappalyzer

Confirm Looker isn't actually meant as Looker Studio, and confirm Wappalyzer's exact slug, before building either.

Phase 5 — Meeting notes (parallel to Zoom) + extra storage

Granola, Fathom, Microsoft OneDrive

Granola/Fathom are read-only transcript sources exactly like Zoom already is — cheapest phase to build since it's the least new design, placed last because it's lower expected volume than the phases above.

4. Open Items Before Any Phase Starts

- Get sign-off on actual phase priority (this document's ordering is technical-reuse-driven, not business-priority-driven).
- Confirm Wappalyzer's exact Nango slug and Looker vs. Looker Studio on Nango's dashboard.
- Confirm whether the existing Google Cloud OAuth app (Phase 1) can add Gmail/Drive/Calendar scopes, or needs a new app.
- Re-run the self-host cost comparison once real connection count from Phase 1–2 usage is available.
